1. INTRODUCTION

1.1 Project Overview

In modern organizations, employee data management plays a critical role in ensuring smooth HR operations and decision-making processes. Employee information includes personal details, job roles, departmental allocation, contact information, and employment status. Managing such data manually using spreadsheets or traditional systems often leads to inefficiencies, errors, and duplication.

With the increasing scale of organizations, the volume of employee data also grows significantly. Manual handling becomes impractical, leading to challenges such as data inconsistency, delayed updates, and lack of centralized control. To overcome these issues, automation is essential.

ServiceNow provides a robust cloud-based platform that enables organizations to automate workflows and manage data efficiently. This project leverages ServiceNow's Import Sets and Transform Maps to automate the process of importing and managing employee data. The system ensures that data is accurately mapped to the User table (sys_user) and stored in a structured format.

The automation process eliminates manual intervention, reduces errors, and improves efficiency. This project demonstrates how ServiceNow can be used to build scalable and reliable data management solutions for real-world applications.

1.2 Purpose

The purpose of this project is to design and implement an automated system for managing employee data in ServiceNow. The key objectives include:

- Automating the process of importing employee data from external sources
- Reducing human errors associated with manual data entry
- Ensuring data consistency and integrity
- Improving efficiency in handling large datasets
- Demonstrating practical implementation of ServiceNow tools

Additionally, the project aims to provide a scalable solution that can be extended to integrate with other enterprise systems such as HR management platforms.

2. IDEATION PHASE

2.1 Problem Statement

Organizations face several challenges when managing employee data manually:

- High chances of human error during data entry
- Duplicate records due to lack of validation
- Difficulty in maintaining and updating large datasets
- Lack of real-time data availability
- Inefficient processes leading to delays

These issues highlight the need for an automated system that can efficiently handle employee data while ensuring accuracy and scalability.

2.2 Empathy Map Canvas

Users: HR Managers, Data Administrators

User Insights:

- **Think:**
  "Managing employee data manually is inefficient and risky."
- **Feel:**
  Overwhelmed by repetitive and time-consuming tasks
- **Say:**
  "We need a system that can automate data handling."
- **Do:**
  Use spreadsheets and manual entry systems

Pain Points:

- Time-consuming processes
- Data duplication
- Errors in employee records
- Difficulty in updating information

Gains:

- Automated data entry
- Accurate records
- Faster processing
- Centralized data management

2.3 Brainstorming

Different approaches were evaluated:

1. Manual Data Entry

- Simple but inefficient
- Not suitable for large datasets

2. Script-Based Automation

- Flexible but complex
- Requires advanced programming skills

3. Database Integration

- Effective but requires additional setup

4. Import Sets + Transform Maps (Selected)

- Easy to implement
- Scalable solution
- Built-in ServiceNow feature

3. REQUIREMENT ANALYSIS

3.1 Customer Journey Map

1. HR prepares employee dataset
2. Uploads data into ServiceNow
3. Data stored in Import Set table

4. Transform Map processes data
5. Records inserted into User table
6. HR verifies employee data

3.2 Solution Requirement

Functional Requirements:

- Upload employee dataset
- Map data fields accurately
- Automate record creation
- Validate input data

Non-Functional Requirements:

- Performance efficiency
- Data security
- Scalability
- Reliability

3.3 Data Flow Diagram (Detailed Explanation)

The system processes employee data in multiple stages:

1. **Input Stage:**
   External dataset is uploaded
2. **Processing Stage:**
   Data is stored in Import Set table
   Transform Map processes data
3. **Output Stage:**
   Data is inserted into User table

Employee Dataset → Import Set → Transform Map → sys_user Table

3.4 Technology Stack

- ServiceNow Platform
- Import Sets
- Transform Maps
- JavaScript (optional scripting)
- CSV/Excel

4. PROJECT DESIGN

4.1 Problem Solution Fit

The proposed solution effectively addresses the challenges of manual data handling by automating the entire process. It ensures accurate data mapping and reduces redundancy.

4.2 Proposed Solution

Steps involved:

1. Prepare dataset
2. Upload using Import Sets
3. Create Transform Map
4. Map fields
5. Execute transformation
6. Verify output

4.3 Solution Architecture

Architecture Components:

- **Data Source Layer:** External dataset
- **Staging Layer:** Import Set table
- **Processing Layer:** Transform Map

- **Application Layer:** User table

5. PROJECT PLANNING & SCHEDULING

5.1 Project Planning

Phase	Description	Duration
Planning	Requirement analysis	1 week
Design	Architecture design	1 week
Implementation	Development	2 weeks
Testing	Validation	1 week
Documentation	Report writing	1 week

6. FUNCTIONAL AND PERFORMANCE TESTING

6.1 Functional Testing

- Verified correct record creation
- Checked field mapping accuracy
- Ensured data integrity

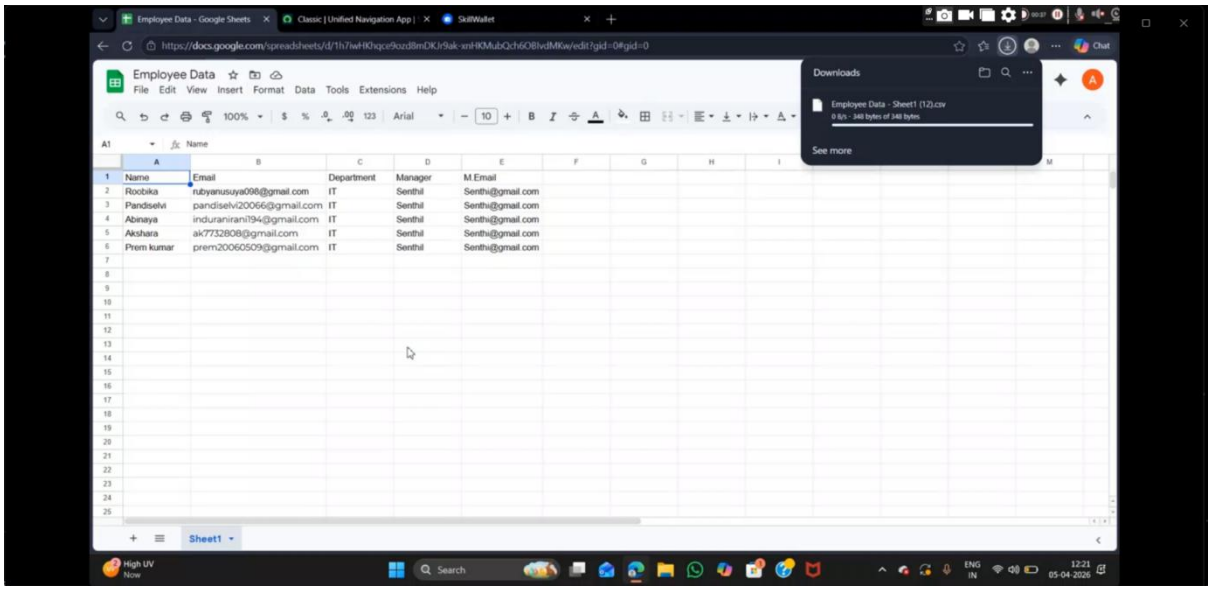
6.2 Performance Testing

- Tested with large datasets
- Measured execution time
- Verified system stability

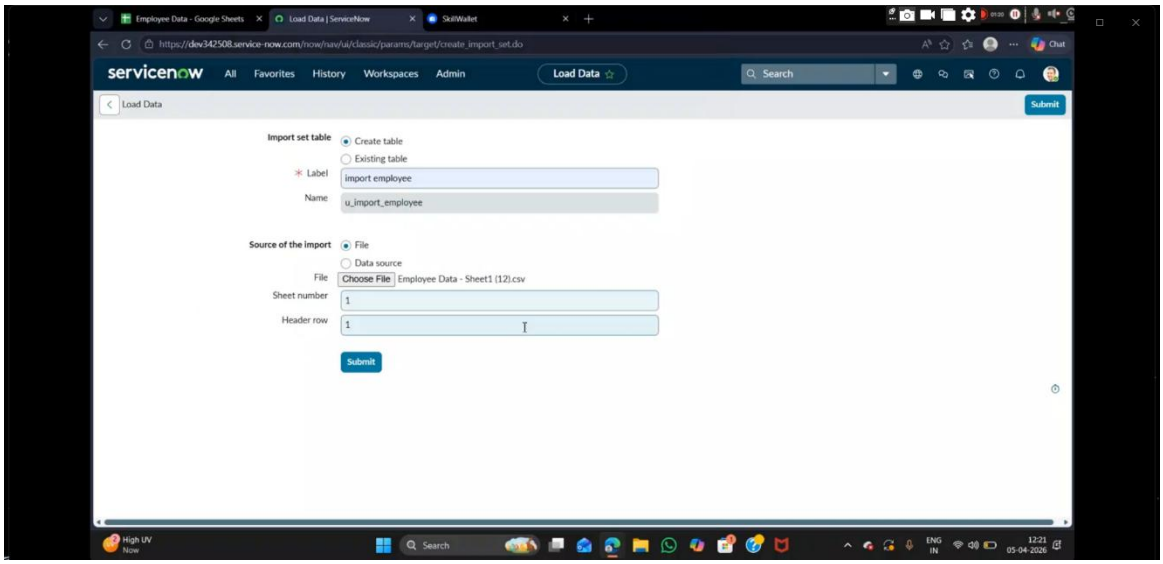
7. RESULTS

7.1 Output Screenshots

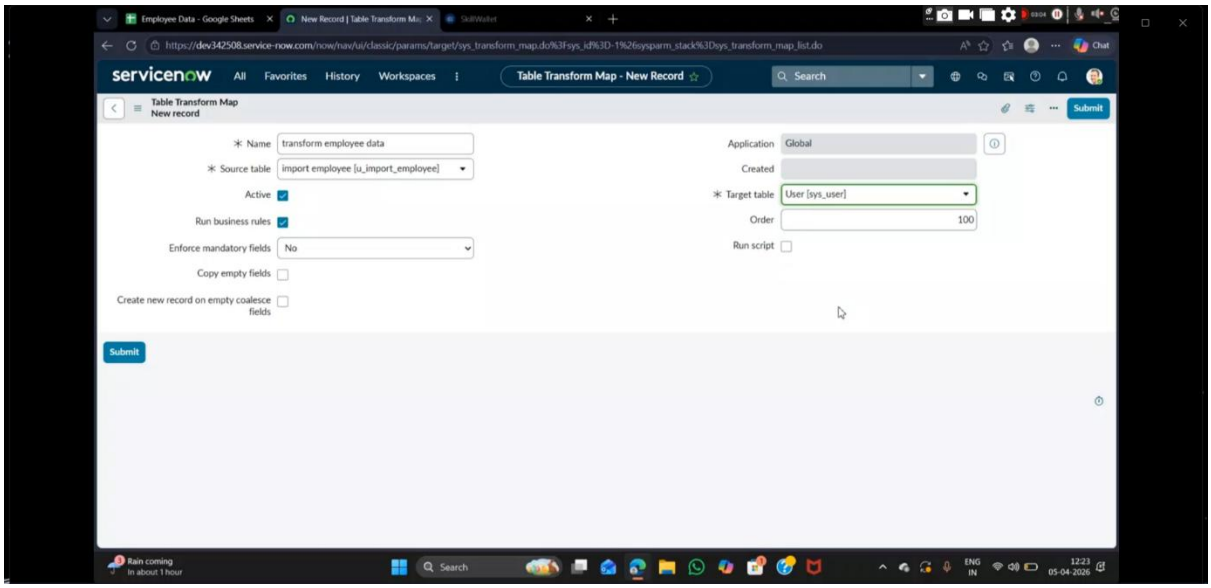
7.1.1 Creating a dataset



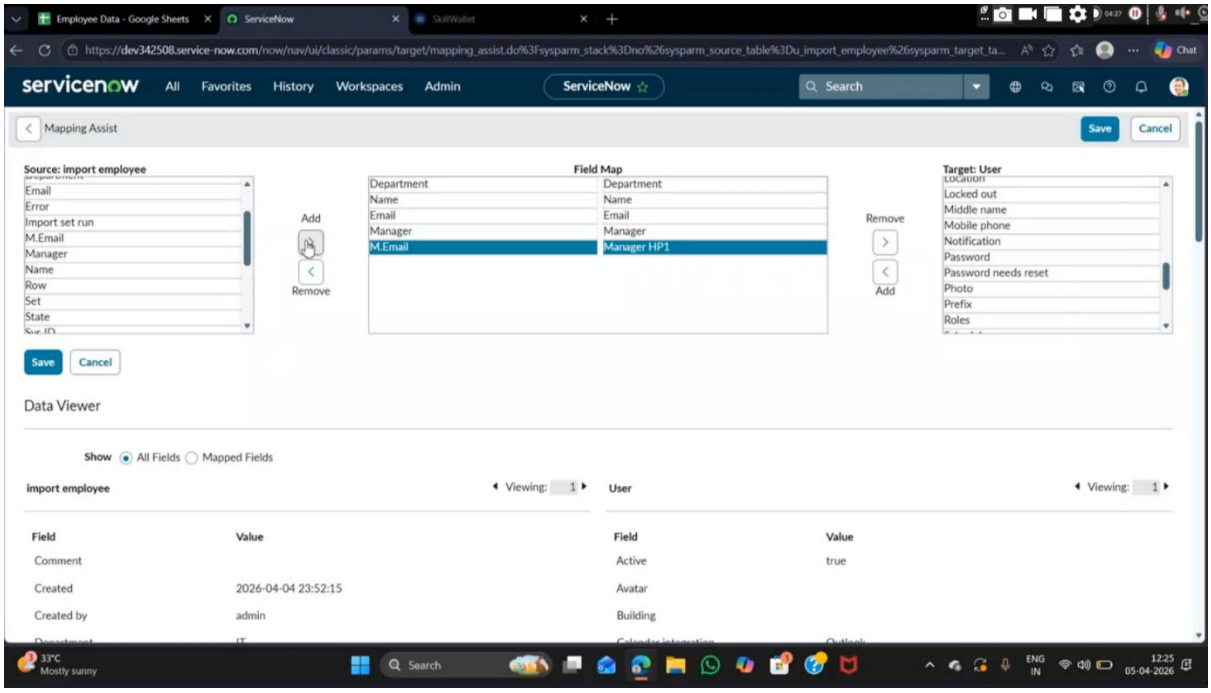
7.1.2 Uploading the csv file to the servicenow



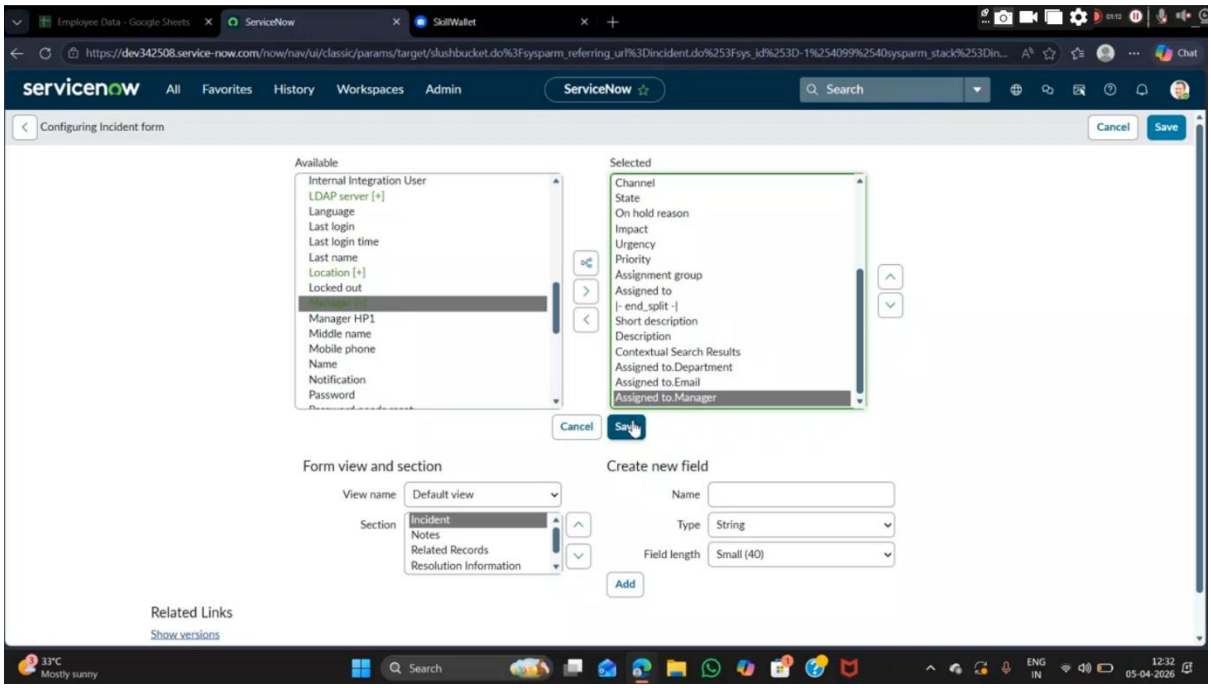
7.1.3 Creating a transform map



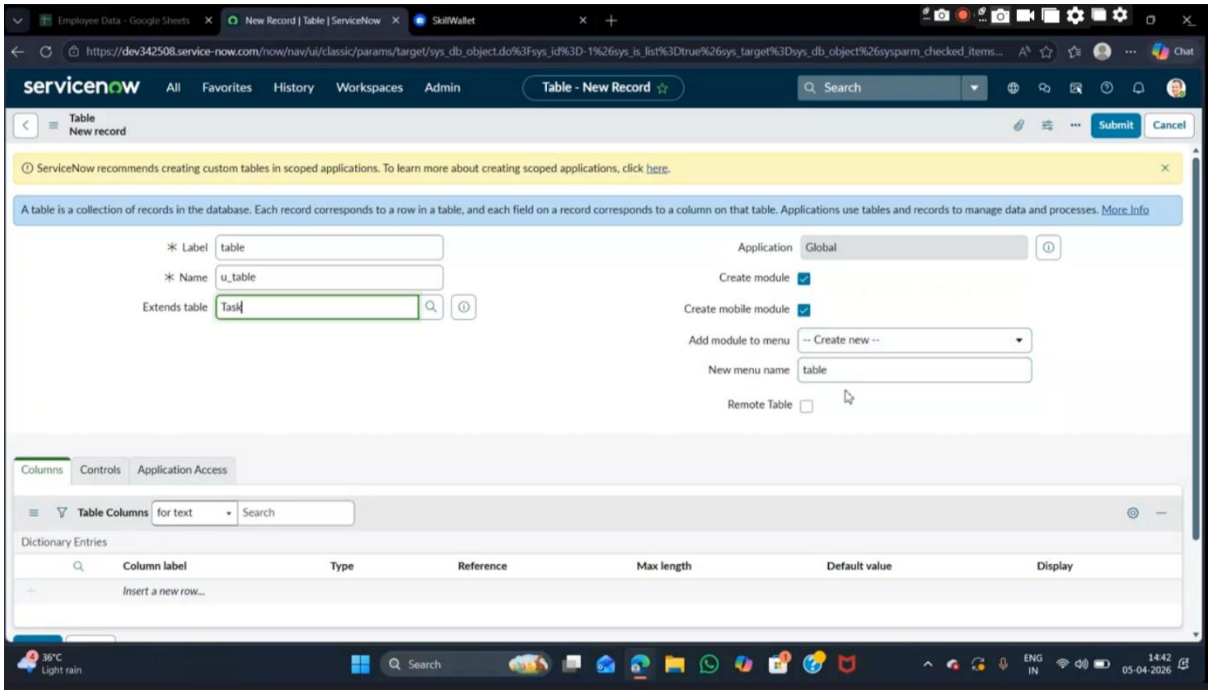
7.1.4 Relationship Mapping



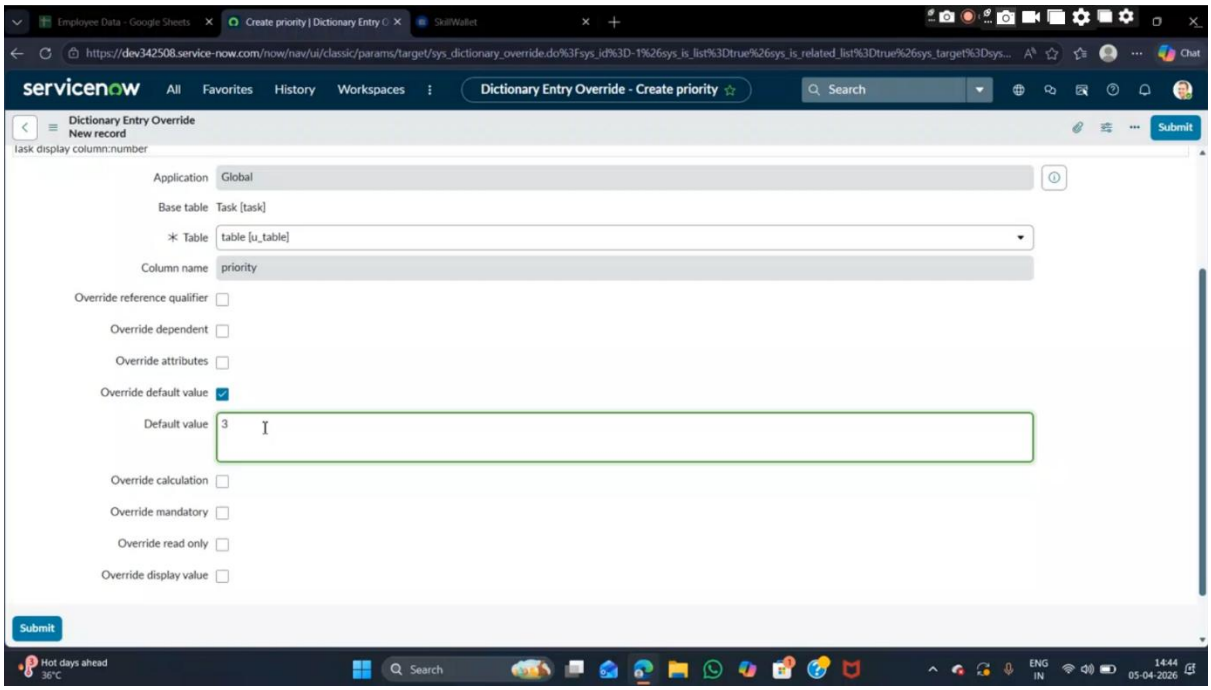
7.1.5 Configuring Incident form



7.1.6 Creating a new table



7.1.7 Override the value of priority



7.2 Observations

- Data imported successfully
- No duplication observed
- Accurate mapping achieved

8. ADVANTAGES & DISADVANTAGES

Advantages

- Reduces manual effort
- Improves accuracy
- Saves time
- Scalable

Disadvantages

- Initial setup complexity
- Requires knowledge of ServiceNow
- Debugging challenges

9. CONCLUSION

The project successfully demonstrates the automation of employee data management using ServiceNow. It highlights the effectiveness of Import Sets and Transform Maps in handling large datasets. The system improves efficiency, accuracy, and scalability, making it suitable for real-world applications.

10. FUTURE SCOPE

1. Integration with HR Systems

The system can be integrated with external HR platforms to automate employee data synchronization.

2. Real-Time Data Processing

Implement real-time data updates instead of batch processing.

3. AI-Based Validation

Use AI to detect duplicate or incorrect data.

4. Workflow Automation

Automate onboarding/offboarding processes.

5. Advanced Reporting

Develop dashboards for analytics.
